

## Press Information

Company profile: optoVision Gesellschaft für moderne Brillenglastechnik mbH

Since its foundation in 1979, optoVision has been producing modern ophthalmic glass technology in Langen. This includes the production of lenses from various materials, in many colors and finishes, from single vision lenses to individual progressive lenses. With nearly 400 employees optoVision produces more than 3 million lenses per year.

In the second business segment "Lab Management Solutions", optoVision offers independent manufacturing plants the transfer of data for the production of Freeform lenses.

As one of the leading Freeform experts, optoVision develops innovative and technically sophisticated products which incorporate the latest insights into optometric research. The production in one of the most modern Freeform productions unifies high-tech precision technology, the know-how of employees, and innovative materials.

As the central component of the company philosophy, optoVision has an integrated view of the seal "Made in Germany": all products are developed and manufactured in Germany. It not only stands for German brand quality but also for innovative technologies. The highly qualified expert personnel ensures highest quality and optimal tolerability of the lenses. Since optoVision considers itself as a partner of independent optometrists in Germany, short shipping distances ensured by the German location are especially important. This also ensures more than 99% delivery reliability.

"Made in Germany" also applies to our training: for instance, every year, optoVision trains process technicians and commercial apprentices in Langen.

In addition to the headquarters in Langen, optoVision is present in 12 European and international markets.
